## INTRODUCCIÓN

El objetivo de este trabajo es plantear una metodología para la elaboración de índices de precios y cantidades del comercio exterior de bienes de Cuba, a partir de los cuales se puedan efectuar los cálculos a precios constantes de las Cuentas Nacionales, así como construir el índice de términos del intercambio.

Esta tarea se desarrolló en el marco del Proyecto “Perfeccionamiento del Sistema de Cuentas Nacionales de Cuba” (BT-SWE-2002) que la CEPAL está ejecutando con el apoyo financiero de la Agencia Sueca de Cooperación Internacional para el Desarrollo (ASDI) del Reino de Suecia, que está orientado a fortalecer el sistema de estadísticas económicas para el perfeccionamiento de las Cuentas Nacionales de Cuba. Para ello, se realizaron dos visitas a la Oficina Nacional de Estadísticas de Cuba que permitieron relevar información de enorme importancia para la elaboración de este documento.

En la primera parte se reúnen en forma sucinta conceptos y definiciones generales para la elaboración de los índices de precios y cantidades, que han sido recomendados por Naciones Unidas en la cuarta revisión del “Sistema de Cuentas Nacionales”. Este marco conceptual será de utilidad para abordar aspectos específicos relacionados con el objetivo de diseñar la estrategia para la elaboración de los índices de comercio exterior. También se desarrollan aspectos ligados a la definición de la fórmula de cálculo, el período base, los problemas originados en los cambios de calidad de los productos a lo largo del tiempo y los que se plantean en los cambios en las clasificaciones de los productos de exportación e importación, entre otros.

En la segunda parte del trabajo se inicia el análisis de la situación de las estadísticas del comercio exterior de Cuba. En primer lugar se plantea la necesidad de analizar la fuente de datos en lo referente a su calidad y oportunidad. A su vez, se establece que será necesario considerar las clasificaciones utilizadas en las declaraciones de las operaciones de comercio exterior, así como en la producción y difusión de las estadísticas de comercio exterior, los plazos de presentación de los datos y la identificación de los principales usuarios de estas estadísticas.

La tercera parte del documento, está dedicada a presentar un método de selección de la muestra de productos de exportación e importación, con el objetivo de lograr cobertura, continuidad y homogeneidad de las operaciones de comercio exterior. El análisis de la homogeneidad de los productos deberá realizarse a través de la construcción y evaluación de la variabilidad de los valores medios. Esta instancia permite confirmar si los productos seleccionados en la primera etapa del análisis conforman en sí mismos “unidades elementales” del índice o merecen un tratamiento particular. Esto significa que a través del estudio de la serie mensual de los valores medios de las operaciones de comercio exterior, se aceptará o no la homogeneidad del producto seleccionado. De no ser así se deberán hacer estudios particulares con el fin de alcanzar especificaciones que permitan lograr el nivel de homogeneidad deseada. Si se agotaran estas posibilidades, se propone la agregación de productos bajo características comunes, así como la inclusión de variables “*proxy*” para el seguimiento de sus precios como deflatores de los grupos de productos. Como conclusión de esta parte, se elaboró un ejercicio de

la aplicación del método de selección a partir de datos de exportaciones e importaciones de los años 1999 a 2001, que se incluye también en este documento.

En la cuarta parte del informe se tratan temas relativos al análisis de la calidad de los datos, ya que de ello depende la construcción de los precios medios. De esta manera se propone un mecanismo para acotar el número de observaciones a analizar y a su vez se presenta un método de análisis exploratorio de datos. Este método no sólo es útil para la identificación de “*outliers*” sino que también permite analizar la variabilidad de los precios medios de los productos definidos por su nomenclatura arancelaria y por el país de destino u origen, según se trate de las exportaciones e importaciones. Por último se plantea en forma sucinta el mecanismo de agregación de las unidades elementales para el armado final del índice de precios.

Conviene aclarar que las recomendaciones están orientadas fundamentalmente a satisfacer las necesidades de las Cuentas Nacionales respecto a los cálculos a precios constantes. Por tal motivo, se pone de manifiesto la necesidad de establecer ciertas definiciones para la elección de una fórmula, una base y una periodicidad para el cálculo. Todas estas definiciones están sin dudas estrechamente vinculadas a la elección del período base de las Cuentas Nacionales y al proyecto de la elaboración de cuentas con periodicidad trimestral. Dado que en la actualidad las Cuentas Nacionales de Cuba tienen base fija en el año 1997, se recomienda la elaboración de índices de precios de comercio exterior utilizando una fórmula de tipo Paasche, considerando como base de cálculo el año 1997 y con periodicidad trimestral.

Los resultados de los ejemplos y del análisis de los datos básicos de comercio exterior de Cuba, están referidos al año 2001, para el que se dispuso de la base estadística correspondiente, proporcionada, por la ONE, para estos efectos, en soporte electrónico.

El voluminoso material cuantitativo resultante obligó a consignarlo en un medio electrónico (CD) que complementa el presente documento, y cuyo contenido se indica en los títulos de los Anexos al mismo.

## I. CONCEPTOS Y DEFINICIONES

### 1. Conceptos y definiciones generales

Los conceptos y definiciones utilizados han sido extraídos de las recomendaciones internacionales vertidas en la cuarta revisión del Sistema de Cuentas Nacionales (1993), de la quinta revisión del Manual de la Balanza de Pagos (1993) y de las “Recomendaciones para la elaboración de estadísticas de comercio exterior” publicadas por Naciones Unidas en el año 1997. Cabe reflexionar sobre la importancia que reviste este tema para la elaboración de las cuentas nacionales y en particular para el conjunto de indicadores que permiten analizar las fluctuaciones económicas, el crecimiento y la inflación. Por este motivo, el Sistema de Cuentas Nacionales dedica un capítulo completo a estas cuestiones, denominado “Medidas de precio y volumen”. Este capítulo puntualiza en sus primeros párrafos que “las variaciones a lo largo del tiempo de los valores de los flujos de bienes y servicios pueden dividirse en dos componentes que reflejan variaciones de sus precios y de sus volúmenes”. Esto implica que para un bien determinado podríamos expresar que:  $V_i = P_i \cdot Q_i$

El valor de un bien único y homogéneo ( $V_i$ ) es igual al precio por unidad de cantidad ( $P_i$ ) multiplicado por el número de unidades de cantidad ( $Q_i$ ). El valor es independiente de la unidad de cantidad elegida; en tanto no sucede lo mismo con el precio, que como puede notarse sí depende de la unidad de cantidad utilizada.

En relación a las características de las cantidades y los precios, se plantean algunas cuestiones que deben ser contempladas en la elaboración de indicadores de la evolución de los precios y volumen en las transacciones económicas. Estas características se resumen en:

- ✓ Las cantidades sólo pueden ser aditivas para un producto único y homogéneo, ya que aunque puedan medirse distintos productos en términos de la misma unidad - como por ejemplo el trigo y el arroz -, la suma de estos volúmenes y sus variaciones a lo largo del tiempo generalmente no tienen significado económico.
- ✓ El precio de un bien o servicio se define como el valor de una unidad de ese bien o servicio. Por esta razón, el precio puede variar arbitrariamente en función de la unidad de medida elegida. Por ejemplo, el precio de una tonelada de trigo y el precio por kilogramo. Así como sucede con el volumen, los precios no son aditivos para los diferentes bienes y servicios. Por lo tanto, un promedio de los precios de diferentes bienes y servicios no tiene significado económico y no puede utilizarse para medir variaciones de precios a lo largo del tiempo.

Por su parte, los valores se expresan en términos de una unidad monetaria común y son commensurables y aditivos para diferentes productos.

El índice de precios es una herramienta estadística que permite medir los cambios de precios a lo largo del tiempo. El índice de precios es el cociente entre  $P_t/P_0$  - o precio relativo -.

Por lo tanto, la fórmula de un número índice simple, o de una “unidad elemental”- como denominaremos en un futuro - es:

$$\text{Índice de precios simple} = P_t / P_o \cdot 100$$

Cuando se desea construir un índice de precios de un conjunto de bienes, es necesario formular un método para agregar los índices simples de los productos que lo componen, ya que como se mencionó anteriormente ni los precios ni las cantidades son aditivos. Los métodos de agregación usualmente contemplan la importancia relativa de cada producto medida a través de su valor, como la forma de ponderar las variaciones de precios o de cantidades.

Por tal motivo, la teoría económica ha intentado dar respuesta a estos problemas de agregación planteando diferentes respuestas. Las fórmulas de índices de precios y de volumen tradicionalmente reconocidas son las de: Laspeyres, Paasche, Tornqvist y Fisher. En los últimos tiempos se han desarrollado los denominados “índices encadenados” que permiten actualizar las muestras de productos utilizados para la medición de los índices de precios. Debido a que existe abundante literatura sobre este tema, sólo se hará referencia a algunas cuestiones relevantes para el análisis de la metodología propuesta.

En relación a las definiciones de precios y volumen, cabe señalar que, por las características de la información de las operaciones de comercio exterior existen ciertas limitaciones, como por ejemplo: para un grupo de bienes se obtendrá información sobre el valor en dólares estadounidenses en tanto la información sobre las unidades de medida puede ser variada. Por ese motivo, suele hacerse una diferencia entre la denominación de índices de precios y volumen y la de índices de valores medios y cantidades, respectivamente. La denominación de valor medio o valor unitario se debe a que se refieren a los valores por unidad de bienes que no son estrictamente homogéneos y que por lo tanto estos valores pueden verse afectados, tanto por cambios en la combinación de artículos que componen el grupo de productos, como por variaciones de sus precios.

Los índices más utilizados son los de tipo Laspeyres y Paasche. Ambas fórmulas se definen como promedios ponderados de precios o de cantidades relativas, considerando como base para la construcción de los ponderadores el valor de cada uno de los productos que componen la muestra del índice, medidos en cada uno de los períodos que se comparan. El índice de precios Laspeyres se define como la media aritmética ponderada de los precios relativos utilizando como ponderaciones los valores del periodo “0” o período base<sup>1</sup>.

En cambio, los índices de precios o volúmenes de Paasche se definen utilizando como ponderaciones los valores del período t y una media armónica de los precios y cantidades relativas<sup>2</sup>.

<sup>1</sup> Un índice de precios de Laspeyres se expresa de la siguiente manera:

$$L_t = \sum_i \frac{v_{i0} \cdot p_t / p_{i0}}{\sum_i v_{i0}} = \frac{\sum_i p_t \cdot q_{i0}}{\sum_i p_{i0} \cdot q_{i0}}$$

<sup>2</sup> Un índice de precios Paasche se define así:

$$P_t = \frac{\sum_i v_{it}}{\sum_i v_{it} \cdot p_t / p_{i0}} = \frac{\sum_i p_{i0} \cdot q_{it}}{\sum_i p_{it} \cdot q_{it}}$$

Esto significa que cuando se elabora una serie temporal de índices de Paasche, las ponderaciones varían de un período a otro, lo que dificulta las interpretaciones de las variaciones de precios entre dos períodos cualquiera de la serie.

Existen numerosas relaciones entre estos dos índices. Vale la pena resaltar la que se observa entre el producto de un índice de precios de tipo Lapeyres y un índice de volumen de tipo Paasche que es idéntico al producto de un índice de precios Paasche y uno de volumen Laspeyres. El valor resultante es idéntico a la variación del valor del flujo de bienes considerado. Esta propiedad permite que los índices de volumen se puedan calcular en forma directa o indirecta. Esto significa que, o bien se realiza el cálculo independiente de los índices de precios y de cantidades, o se obtiene este último como cociente entre el índice que mide los cambios en el valor entre dos períodos por el índice que mide los cambios en los precios.

$$IV = L_p \cdot P_q = P_p \cdot L_q = \frac{\sum p_t q_o}{\sum p_o q_o} \cdot \frac{\sum p_t q_t}{\sum p_t q_o} = \frac{\sum p_t q_t}{\sum p_o q_t} \cdot \frac{\sum p_o q_t}{\sum p_o q_o}$$

De acuerdo con lo señalado precedentemente, este último procedimiento permite obtener índices de cantidades del tipo Laspeyres a partir de índices de precios del tipo Paasche y viceversa. Por eso, cuando se dispone de datos independientes, confiables y completos a precios corrientes, no es necesario calcular medidas de precios y volumen, ya que las unas pueden deducirse indirectamente de las otras, según se ha comentado más arriba.

$$L_q = \frac{IV}{P_p} \quad \text{ó} \quad P_q = \frac{IV}{L_p}$$

Otro problema crucial para la elaboración de índices de precios y cantidades reside en los cambios de calidad que se produce en los bienes a lo largo del tiempo. Para ello, las recomendaciones internacionales plantean distintas opciones:

- ✓ Ignorar el cambio de calidad y elaborar un precio relativo como si no existiera diferencia de calidad;
- ✓ Omitir los artículos en cuestión y no elaborar un precio relativo para ellos;
- ✓ Ajustar el precio observado de la nueva calidad al cambio de calidad que ha tenido lugar;
- ✓ Tratar las dos calidades como si fueran dos bienes separados y estimar sus precios en los períodos en que no se venden.

En este sentido, las recomendaciones sugieren que no se adopten ninguna de las dos primeras opciones ya que se introducirían sesgos en la construcción del índice; en tanto, que las tercera y cuarta son las preferidas, aun cuando también se reconoce que no son fáciles de aplicar en la práctica. Existen diferentes métodos, dependiendo de los datos disponibles. Uno de estos métodos, consiste en utilizar la hipótesis hedónica. Esta hipótesis supone que los precios de diferentes modelos en venta al mismo tiempo en el mercado son función de ciertas características mensurables como el tamaño, peso, potencia, velocidad, etc. El inconveniente que se plantea para utilizar este método es la cantidad de observaciones que se requieren para construir una regresión.

Por último, la elaboración de índices de precios de exportación e importación adquiere especial relevancia en el cálculo del ingreso total real. En efecto, el ingreso total real depende de la relación a la que las exportaciones se negocian frente a las importaciones del resto del mundo. Si los precios de exportación de un país crecen más rápidamente que los precios de sus importaciones, mejoran sus términos del intercambio. Esto implica que se necesitan menos exportaciones para pagar un volumen determinado de importación. O sea, considerando un nivel dado de producción interna pueden reasignarse bienes y servicios desde la exportación al consumo o a la formación de capital. Por lo tanto, una mejora en los términos del intercambio puede provocar una divergencia significativa entre los movimientos del producto a precios constantes y los del ingreso real. La diferencia entre las variaciones del PIB a precios constantes y los del IIB real recibe generalmente el nombre de “ganancia o pérdida de intercambio” que son medidas por la expresión siguiente:  $T = \frac{X - M}{P} = \left( \frac{X}{P_x} - \frac{M}{P_m} \right)$

En la que

X representa las exportaciones a precios corrientes

M representa las importaciones a precios corrientes

$P_x$  significa índices de precios de exportaciones

$P_m$  significa índices de precios de importaciones

P es un índice de precios basado en algún numerario seleccionado

El resultado de las ganancias o pérdidas de los términos del intercambio depende en gran medida de la elección del índice de precios P. Existe una amplia literatura sobre el tema aunque no es concluyente. Las principales alternativas pueden plantearse como sigue:

- ✓ Elegir al índice de precios de importaciones como P, o en su defecto el índice de precios de exportaciones. Algunos autores afirman que la elección entre  $P_x$  y  $P_m$  debe depender de que la balanza comercial sea negativa o positiva,
- ✓ Elegir el promedio de  $P_x$  y  $P_m$ , puede elegirse la media aritmética o armónica simple,
- ✓ Elegir un índice general de precios que no provenga del comercio exterior, por ejemplo el índice del gasto final interno bruto o el índice de precios al consumidor.

La propuesta recomendada en este caso es que las autoridades estadísticas de cada país elijan el deflactor que utilizarán, teniendo en cuenta las circunstancias particulares del mismo. Lo que sí se pretende es evitar que la falta de definición sobre un deflactor común impida que se calculen medidas agregadas del ingreso real. Es aconsejable que todos los países dispongan de cálculos de alguna medida de las ganancias del intercambio.

## **2. Estrategia para la elaboración de los índices de precios y cantidades del comercio exterior de Cuba**

Considerando el marco conceptual expresado anteriormente, se discutirán en esta sección los pasos a seguir para la elaboración de los índices de precios y cantidades del comercio exterior de Cuba. En realidad, se sugiere aplicar para los índices de cantidades el método indirecto, expuesto precedentemente; o sea como cociente de los índices de valor y de precios.

Como esquema de trabajo se pueden definir las siguientes etapas:

- ✓ Definición del marco conceptual, elección de la fórmula a aplicar y del período base, establecer la periodicidad, las clasificaciones que se utilizarán para desagregar el índice.
- ✓ Análisis de las fuentes de datos, utilización de fuentes de datos alternativas.
- ✓ Análisis de la información, control de calidad sobre los datos obtenidos para los valores medios, detección de valores extremos.
- ✓ Selección de la muestra, elección de unidades elementales a partir del análisis de la variabilidad de los valores unitarios, búsqueda de información exógena sobre la evolución de los precios internacionales o de los principales proveedores de los grupos de productos con altos niveles de variabilidad.
- ✓ Construcción de la estructura de ponderadores derivada de la elección de unidades elementales y de los agrupamientos de productos hasta alcanzar el nivel general de las exportaciones y las importaciones.
- ✓ Elaboración del índice de precios de exportaciones e importaciones.

Tal como se explicó anteriormente, se considerarán como marco teórico las recomendaciones internacionales en la materia que han sido desarrolladas precedentemente. En cuanto a la fórmula de cálculo de los índices de precios se utilizará una de tipo Paasche con una periodicidad trimestral. El período base es el año 1997, considerado año base de las Cuentas Nacionales. Estos temas así como el análisis de las fuentes de datos serán tratados más adelante.

Sin embargo, vale la pena destacar la necesidad de conocer en profundidad las características y transformaciones que sufren las fuentes de información. Las estadísticas de comercio exterior, que tienen una larga tradición en la Oficina Nacional de Estadística de Cuba, se elaboran a partir de registros aduaneros que recoge la Aduana General de la República de Cuba.

En la actualidad se han producido cambios en la normativa y procedimientos aduaneros. En este sentido, resulta muy importante la norma que estableció la obligatoriedad de que todos los exportadores cumplimenten el trámite aduanero, lo que trajo aparejado una mejora de la cobertura. También se espera mejorar la agilidad y mejora en el control y calidad de la información a partir de la aplicación en la totalidad de las aduanas del “Sistema Automatizado para el Despacho Aduanero de Mercancías” (SADEM) desarrollado por la Aduana.

La información recogida por la Aduana General de la República de Cuba refleja entre otras variables el valor y volumen de las compras y ventas al exterior de mercaderías. El valor de las mercaderías se declara para las exportaciones sobre la base de la valoración libre a bordo (FOB) y en cambio para las importaciones se declara sobre la base de costo, seguro y flete (CIF).

Por su parte, la información sobre las unidades de volumen son dos y en algunos casos pueden coincidir. Estas medidas se refieren al peso y la unidad de medida estadística. Esta última varía de acuerdo con el tipo de mercadería y está establecida a nivel internacional. En lo referente a la unidad de peso, el registro aduanero contiene información sobre el peso bruto y neto que se mide en kilogramos. El peso bruto declarado tiene relación con el consignado en los documentos de transporte o comerciales y debe ser al menos igual o superior al peso neto. Estas variables resultan de mucha importancia para los cálculos que se realicen sobre el valor medio de las mercaderías importadas o exportadas.<sup>3</sup> Por tal motivo, se recomienda que dado que el cálculo de los valores medios serán insumos, tanto del análisis y definición de las unidades elementales que conformarán los índices de precios así como de su futuro cálculo, es primordial realizar un control de la calidad de los mismos<sup>4</sup>. Por otra parte, será imprescindible para cada unidad elemental la elección de una de estas dos unidades dependiendo de la interpretación que pueda hacerse a partir de cada una de ellas.

Las compras y ventas de mercaderías al exterior son declaradas a la autoridad aduanera según la clasificación establecida en el Sistema Armonizado de Clasificación de Productos (SACLAP). Este clasificador está formado por ocho dígitos y respeta el Sistema Armonizado de Designación y Codificación de Mercaderías (SA) de la Organización Mundial de Aduanas en los primeros seis dígitos. Aunque esta clasificación no siempre garantiza la homogeneidad de los productos, resultará la clasificación utilizada para la selección de la muestra de productos que integrarán el cálculo de los índices de precios.

Esta clasificación puede sufrir aperturas o cierres de posiciones arancelarias y deben preverse métodos para tratarlos, ya que los índices de precios considerarán en muchos casos a alguna de estas clasificaciones como unidades elementales del cálculo. Por lo tanto, estos cambios pueden afectar por ejemplo las unidades elementales, la unidad de medida o el método de agregación de un grupo de bienes. Los cambios en los códigos del SA generalmente involucran:

- ✓ Un número del SA cambia pero no el contenido. Este nuevo código se agrega en forma directa para continuar la serie.
- ✓ Más de un código del SA se combinan en un nuevo código del SA. Esta situación es relativamente común y reduce el número de códigos. Si los atributos de todos los viejos códigos es el mismo, el nuevo código toma el lugar de los viejos. Cuando el código que aparece no tiene una franca correspondencia con los anteriores, sólo el analista podrá decidir basándose en los atributos del código que se incorpora.

---

<sup>3</sup> Más adelante se utilizará esta variable para el cálculo de los valores medios de las mercaderías ya que resulta una variable más confiable que la unidad de medida estadística por su relación con el peso consignado en los documentos de transporte. Sin embargo, antes de construir estos valores para el cálculo de los índices de precios se recomienda el análisis de su calidad.

<sup>4</sup> Para ello, se pueden construir relaciones entre los valores y las diferentes unidades de medida empleadas y entre las diferentes unidades de medida, de modo que detectar parámetros estables que permitan detectar outliers con rapidez y eficiencia.

- ✓ Un código del SA se descompone en al menos dos nuevos códigos. En muchos casos esta apertura responde a la necesidad de diferenciación de productos que se clasificaban en la misma posición arancelaria, por lo que el analista deberá investigar esta situación. De no marcar una diferencia entre los nuevos productos se podrán agrupar los nuevos códigos para continuar la serie.

El primer caso es sencillo y no precisa mayores aclaraciones, razón por la cual sólo se realizan aclaraciones para los restantes.

El segundo caso de la fusión de códigos puede presentarse de la siguiente manera:

- ✓ siendo dos códigos distintos que conforman las unidades elementales  $i_1$  e  $i_2$ , e  $i^*$  la nueva unidad elemental resultante de la fusión de ambos códigos, se procede a calcular el precio medio de la nueva unidad sumando las anteriores  $i_1$  e  $i_2$ . De este modo se calcula el precio medio en la base y en el período anterior.

Donde,

$$Pi_{i-1}^* = \frac{vi_{1,t-1} + vi_{2,t-1}}{qi_{1,t-1} + qi_{2,t-1}} \quad y \quad Pi_0^* = \frac{vi_{1,0} + vi_{2,0}}{qi_{1,0} + qi_{2,0}}$$

El último de los casos se refiere a la incorporación de nuevos códigos y se puede expresar de este modo:

- ✓ siendo  $i$  la unidad elemental original que se divide en el trimestre  $t$  en  $i_1$  e  $i_2$ , el cálculo en el trimestre  $t$  se realiza reconstruyendo  $i$  a partir de la suma de los valores  $(vi_1 + vi_2)$  y las cantidades  $(qi_1 + qi_2)$  de la siguiente manera,

$$Pi_t^* = \frac{vi_{1,t} + vi_{2,t}}{qi_{1,t} + qi_{2,t}}, \text{ resultando } Ii_t^* = \frac{Pi_t^*}{Pi_{t-1}^*} \cdot Ii_{t-1}$$

- ✓ en el siguiente trimestre  $t+1$ , se procede a incluir las dos nuevas unidades elementales,

$$Ii_{1,t+1} = \frac{Pi_{1,t+1}}{Pi_{1,t}} \cdot Ii_t^* \quad y \quad Ii_{2,t+1} = \frac{Pi_{2,t+1}}{Pi_{2,t}} \cdot Ii_t^*$$

Los registros sobre el valor de las compras y ventas de mercaderías, según las clasificaciones de la SACLAP son considerados en el momento de la selección de la muestra. El objetivo de esta etapa es elegir los productos que aseguren cobertura, continuidad en el tiempo y homogeneidad. Con posterioridad, se utilizarán estos valores para el cálculo de la estructura de ponderaciones que será necesaria para el armado final de los números índices.

Las tareas de recolección de datos y análisis de la información de valores medios para cada uno de los productos comercializados permitirán confirmar si los productos seleccionados por su cobertura, permanencia en el tiempo y homogeneidad pueden ser considerados como “unidades elementales”. De lo contrario, será necesario evaluar la posibilidad de agruparlos

buscando niveles agregados dentro de las clasificaciones utilizadas. En este caso, se utilizará la clasificación utilizada para la difusión de los datos de exportación y la Clasificación de Grandes Categorías Económicas para las importaciones. Estas “unidades elementales” formadas por grupos de productos requerirán de otra tarea que será la búsqueda de información sobre la evolución de los precios de comercio exterior que será exógena a la información aduanera de basen.

Esto es así ya que cuando el valor medio de un producto no es suficientemente indicativo, esto es no se muestra un bajo nivel de variabilidad, tal como maquinarias, automóviles, se sustituye el valor medio por un índice sustituto o “*proxy*” de una fuente externa de datos. Una vez que se determine la necesidad de utilizar una variable “*proxy*”, se debe realizar la búsqueda de datos que tengan una cobertura y periodicidad adecuada<sup>5</sup>. En la actualidad es posible encontrar en Internet publicaciones gratuitas y actualizadas que pueden ser de mucha utilidad.

Esta información de otras fuentes también puede resultar útil durante el proceso de control de calidad de los valores unitarios. Si en ese proceso, se identifica como un *outlier* el valor medio de una mercadería, es aconsejable que intervenga un analista, con la ayuda de esta información o la que pueda obtener consultando al exportador o importador de la mercadería en forma directa o a través de la Aduana, de modo de tomar los recaudos que considere oportunos. Sus opciones pueden ser la de imputar manualmente el dato, separarlo hasta que logre más información que permita confirmarlo o conocer la naturaleza de la transacción, o desecharlo.

Debido a que los valores medios y las cantidades se evalúan a través de la información provista por la Aduana, se deben hacer todos los esfuerzos para asegurar que la información administrativa sea conceptualmente correcta. En particular que la información sobre las unidades de medida de los productos sea coherente. Teniendo en cuenta el desarrollo del “Sistema Automatizado para el Despacho Aduanero de Mercancías” (SADEM) está a cargo de la Aduana, sería deseable coordinar esfuerzos y aprovechar los conocimientos que ambos organismos poseen para mejorar la calidad de los datos.

---

<sup>5</sup> Varias organizaciones difunden información sobre los precios de sus productos de importación o exportación que puede ser utilizada en estos casos. Estos organismos son:

- ✓ Naciones Unidas
- ✓ World Bank
- ✓ Bank of Japan Export Price Index. El Banco de Japón provee Índices de Precios Mayoristas. Estos índices pueden ser utilizados para deflactar productos de importación originarios de este país.
- ✓ Bureau of Economic Analysis. Índice de Precios de Computadoras por componente
- ✓ United States Bureau of Labor Statistics. Índices de Precios de Productos (PPI). Este programa provee 2000 índices a varios niveles de agregación.

## II. FUENTES DE INFORMACIÓN UTILIZADAS

### 1. Sus antecedentes y perspectivas futuras

La elaboración de las Cuentas Nacionales y las estadísticas de comercio exterior están a cargo de la Dirección de Cuentas Nacionales de la Oficina Nacional de Estadística, cuya Dirección está actualmente a cargo de la Lic. Caridad Noa. La ONE es la institución gubernamental responsable de elaborar y difundir las estadísticas oficiales, tanto en el ámbito nacional como internacional. Desde el año 1982, el sistema de recolección de datos para la elaboración de las estadísticas de comercio exterior se basaba en la captación directa a las empresas, por parte del Ministerio de Comercio Exterior (MINCEX). Este organismo concentraba la mayor parte de las transacciones de comercio exterior del país.

Las fuentes utilizadas para la elaboración de las estadísticas de comercio exterior han variado a lo largo del tiempo por influencia de los cambios que se produjeron en la economía cubana durante la década de los años 90. Es por ello que hasta el año 1998 se utilizó la información suministrada por los ministerios y empresas, los que intervenían aprobando las operaciones de comercio exterior.

A lo largo de la década de los 90 se pueden identificar fechas en las que se introdujeron cambios en la operatoria del comercio exterior así como la adopción de clasificaciones internacionales, lo que más adelante será considerado de importancia para la elaboración del índice de precios del comercio exterior y su comparabilidad internacional. Se detallan las más importantes:

- ✓ Año 1992. La Aduana General establece la “Declaración de Mercancías” como instrumento de registro de las operaciones de comercio exterior. Sin embargo este instrumento todavía no es considerado para la elaboración de estadísticas de comercio exterior.
- ✓ Año 1994. Se aprueba el Sistema Armonizado de Clasificación de Productos (SACLAP).
- ✓ Año 1995. La Aduana General comienza a procesar la información de las operaciones de comercio exterior que se registran a través de la “Declaración de Mercancías”.
- ✓ Año 1996. Se aprueba el nuevo Arancel de Aduanas.
- ✓ Año 1997. Se adoptan las unidades de medida basadas en las recomendaciones de la OMA establecidas por el Sistema Armonizado y se comienzan a elaborar las estadísticas de importación a partir de la información relevada por la Aduana General. Por su parte, las estadísticas de exportación se siguen elaborando a partir de los datos suministrados por las empresas estatales y ministerios.
- ✓ Año 1998. Se procesan los datos provenientes de la Aduana y los suministrados por el MINCEX.

- ✓ Año 1999. Se incorpora la información registrada en la “Declaración de Mercancías” para la elaboración de las estadísticas de comercio exterior adoptándose las recomendaciones internacionales en la materia.
- ✓ Año 2001. Se introducen cambios en la “Declaración de Mercancías”.
- ✓ Año 2003. Se implementa un nuevo SACLAP que recoge las modificaciones introducidas en el Sistema Armonizado a partir del 1º de enero de 2002.
- ✓ Segundo semestre de 2003. Se prevé extender a todas las aduanas del país el “Sistema Automatizado para el Despacho Aduanero de Mercancías “ (SADEM).

Como se puede observar, los cambios introducidos han permitido contar con información completa de todas las operaciones de comercio exterior<sup>6</sup>. Asimismo la fuente aduanera no sólo ha permitido obtener una amplia cobertura sino que los registros reúnen condiciones de homogeneidad y comparabilidad a nivel internacional de las variables relevadas.

Por otro lado, las perspectivas futuras ante la implantación del SADEM<sup>7</sup> son favorables en término de alcanzar mayor rapidez en la disponibilidad de los datos y mejora en su calidad como consecuencia de los controles automáticos que incorpora este Sistema. Asimismo, este nuevo Sistema pone en vigor un nuevo modelo de Declaración de Mercancías, el que deben presentar las personas jurídicas naturales autorizadas, radicadas en el territorio nacional ante la Aduana para formalizar las operaciones de importación y exportación. También se establecen una serie de definiciones de las variables contenidas en el nuevo modelo para facilitar el llenado de los mismos y garantizar cierta calidad en la información.

En lo referente al sistema de registro, Cuba basa sus estadísticas de comercio exterior en el denominado “Sistema Comercial Especial”, ya que considera como territorio estadístico al territorio aduanero. Dado que desde el año 1996 existe en Cuba espacios dentro del territorio destinados a zonas francas, se realizan desde ese espacio transacciones comerciales con el resto del mundo. La ONE trabaja actualmente en la obtención de esta información con el fin de adaptar sus estadísticas al “Sistema Comercial General” tal como lo sugieren las recomendaciones de Naciones Unidas.

---

<sup>6</sup> De acuerdo con lo establecido en el Decreto Ley N° 162 de Aduanas de fecha 3 de abril de 1996, se establece “la obligación de declarar ante la Aduana todas las mercancías, bienes y valores que se importen o exporten por el país, aún aquellos que estén libres del pago de los derechos de aduanas, tasas y demás impuestos recaudables en las aduanas”.

<sup>7</sup> Por resolución N°13/2000 que comenzó a regir a comienzos del año 2001, dispuso la implantación de un nuevo sistema automatizado denominado “Sistema Automatizado para el Despacho Aduanero de Mercancías” para “garantizar la rapidez en el cumplimiento de las funciones aduaneras y un adecuado nivel de facilitación y control”.

## 2. Información relevada en la actualidad

La Dirección de Cuentas Nacionales de la ONE recibe con periodicidad mensual, entre los días 8 a 10 de cada mes un archivo conteniendo parte de la información contenida en la “Declaración de Mercancías”, según la solicitud efectuada por la ONE de las variables que resultan de interés para la confección de las estadísticas de comercio exterior. La información remitida cada mes corresponde al total de operaciones aprobadas desde el inicio del año hasta el mes informado.

La Aduana General de la República de Cuba recoge hasta el presente las declaraciones que se completan manualmente y que son presentadas por los importadores, exportadores o sus agentes de aduana. Una vez que la autoridad aduanera aprueba la operación, ingresa los datos de los mismos a una base de datos de la cual extrae mensualmente los datos que remite a la ONE. Dada la normativa vigente, estas operaciones pueden ser modificadas en un plazo de seis meses desde la fecha de su aprobación. Es por ello, que la información remitida tiene carácter provisorio.

La información suministrada por la Aduana corresponde a cada uno de las mercaderías exportadas o importadas y no a las transacciones realizadas por los exportadores o importadores. La diferencia entre ambos criterios radican en que las transacciones realizadas por los exportadores e importadores pueden reunir más de un tipo de mercadería. La importancia de recoger los datos a nivel de transacción y no de cada línea de mercadería que la compone está relacionada con que la primera corresponde a la unidad primaria de observación de la Aduana. Es conveniente contar con la información de cada transacción ya que de ese modo se pueden realizar controles a la calidad de los datos recibidos tales como completitud de la base, consistencia de la información de cada transacción de las mercaderías que lo componen, etc.

Las variables informadas a la ONE provienen de la “Declaración de Mercancías”<sup>8</sup> y se detallan a continuación:

- Nombre y código de la aduana de despacho.
- Operación: importación o exportación.
- Tipo de declaración.
- Nombre y código del importador/exportador.
- Nombre y código del país donde fueron embarcadas las mercaderías con destino a Cuba o hacia el cual son transportadas las mercaderías de exportación.
- Nombre y código del país hacia el cual se envían las mercaderías de exportación (último destino).
- Nombre y código del país donde tiene su lugar de residencia el comprador o vendedor de las mercaderías, según corresponda a exportaciones o importaciones, respectivamente.
- Nombre y código correspondiente a la condición de entrega contractual (*Incoterms*).
- Nombre y código de la Aduana por donde son descargadas o cargadas las mercaderías declaradas.
- Código del modo de transporte utilizado.

---

<sup>8</sup> El modelo de la Declaración de Mercancías vigente y la metodología para su llenado se presentan en los Anexos I y II, respectivamente.

- Descripción y código de la nacionalidad del medio de transporte
- Descripción y código de la moneda utilizada para la transacción (debe corresponder a dólares estadounidenses<sup>9</sup>).
- Tasa de cambio vigente que fije el Banco Central de Cuba entre la moneda nacional y la moneda en la que se declara ( el tipo de cambio vigente entre el peso cubano y el dólar estadounidense es igual a 1).
- Código de la descripción de la mercadería de acuerdo con la Nomenclatura del Sistema Armonizado de Clasificación de Productos (SACLAP).
- Régimen Aduanero. Ejemplo: exportación definitiva, temporal, reexportación, importación definitiva, etc.
- Nombre y código del país de origen de la mercancía de acuerdo a lo establecido en las Normas de Origen de las Mercancías.
- Siglas y código del Acuerdo, cuando exista éste al nivel de la Declaración de la Subpartida.
- Peso bruto en kilogramos de la mercancía declarada según la SACLAP
- Peso neto en kilogramos de la mercancía declarada
- Nombre y código de la unidad de medida establecida por la ONE que corresponda según la posición arancelaria declarada.
- Nombre y código que corresponda a la condición de pago por ejemplo: contado, arrendamiento, donaciones y consignaciones.
- Valuación de las mercaderías: Costo, seguro y flete (CIF) para las importaciones y libre a bordo (FOB) para las exportaciones.
- Valor en dólares estadounidenses del flete.
- Valor en dólares estadounidenses del seguro.
- Otros gastos que se enumeran en las normas de valoración en Aduanas, conforme a lo establecido en el art. 8 del Acuerdo de Valoración de la Organización Mundial de Comercio.
- Valor de la base imponible.

Actualmente en Cuba se elaboran estadísticas de comercio exterior utilizando valores FOB para las exportaciones y CIF para las importaciones, tal como lo indican las recomendaciones de Naciones Unidas para la elaboración de estadísticas de comercio exterior. Sin embargo, las estadísticas de balanza de pagos requieren de valoraciones FOB para ambos casos. Se estima que a partir de los cambios que se van a introducir en el nuevo sistema de registro de las operaciones ante la Aduana será factible el cálculo a valores FOB de las estadísticas de importación.

Las clasificaciones utilizadas son:

- ✓ Sistema Armonizado de Designación y Codificación de Mercancías (SA)
- ✓ Clasificación Uniforme para el Comercio Internacional de Naciones Unidas (CUCI)
- ✓ Clasificación por Grandes Categorías Económicas

---

<sup>9</sup> Si la transacción se realiza en una moneda distinta al dólar estadounidense, el declarante debe calcular la conversión a la moneda dólar considerando el tipo de pase ("cross rate") promedio cierre de la semana anterior.

- ✓ País de origen y País de destino
- ✓ Clasificación nacional para las exportaciones

### III. ESTRATEGIA PARA LA SELECCIÓN DE LA MUESTRA

#### 1. Metodología de cálculo

Los índices de precios de exportaciones e importaciones se elaborarán sobre la base de una selección de las denominadas “unidades elementales”, la determinación de sus valores medios y la elección de la fórmula de cálculo, que como ya se adelantó corresponderá a una fórmula de tipo Paasche con ponderaciones móviles y base en el año 1997. La fórmula a aplicar es:

$$(1) \quad IP_{jt} = \frac{\sum_i P_{ijt} \cdot q_{ijt}}{\sum_i P_{io} \cdot q_{ijt}} \cdot 100$$

donde:

$IP_{jt}$  : Índice de precios en el trimestre j del año t.

$P_{ijt}$  : valor unitario de la unidad elemental i en el trimestre j del año t.

$q_{ijt}$  : cantidad de la unidad elemental i en el trimestre j del año t.

$P_{io}$  : valor unitario de la unidad elemental i en el año base 1997.

También puede expresarse la fórmula (1) como la media armónica de los índices elementales tal como sigue:

$$(2) \quad IP_{jt} = \frac{100}{\sum_i P_{io} \cdot \frac{q_{ijt}}{\sum_i P_{ijt} \cdot q_{ijt}}} = \left[ \sum_i \left( \frac{P_{ijt}}{P_{io}} \right)^{-1} \cdot \frac{P_{ijt} \cdot q_{ijt}}{\sum_i P_{ijt} \cdot q_{ijt}} \right]^{-1} \cdot 100 = \left( \sum_i I_{ijt}^{-1} \cdot w_{ijt} \right)^{-1} \cdot 100$$

Siendo  $I_{ijt}$  y  $w_{ijt}$  el índice de la unidad elemental i y su ponderación correspondiente, ambos calculados en el trimestre j del año t.

Cabe destacar que como resultado de la aplicación de un índice de precios de tipo Paasche para deflactar los valores corrientes de las exportaciones e importaciones de bienes se obtienen índices de volumen de tipo Laspeyres.

Tal como se ha definido en la fórmula de este índice de precios, su construcción exige en primer lugar la selección y definición de cuáles serán las “unidades elementales”, así como cuál será la base de agregación del mismo, ya que:

$$(3) \quad IP_{jt} = \left( \sum_{N_i} IP_{N_i, jt}^{-1} \cdot w_{N_i, jt} \right)^{-1} \cdot 100$$

donde:

$IP_{jt}$  : Índice de precios del nivel general en el trimestre  $j$  del año  $t$ .

$IP_{N1jt}$  : Índice de precios del primer nivel de agregación ( $N_1$ ), en el trimestre  $j$  del año  $t$ .

$W_{N1jt}$  : Ponderación de los elementos del primer nivel de agregación ( $N_1$ ) en el trimestre  $j$  del año  $t$ .

Para ello debe aclararse cuál es la base para definir una unidad elemental así como cuál será la base para la agregación del índice. En ambos casos deben considerarse las clasificaciones disponibles. En el primer caso se sugiere hacer un análisis a nivel de cada posición arancelaria y considerar como base para la agregación del mismo las clasificaciones utilizadas. Parece apropiado emplear entonces las clasificaciones utilizadas en las publicaciones de las estadísticas de comercio exterior. Las exportaciones se desagregan en una clasificación que si bien no es internacional es de amplio uso local e incluye:

- ✓ Productos de la industria azucarera
- ✓ Productos de la minería
- ✓ Productos de la industria del tabaco
- ✓ Productos de la pesca
- ✓ Productos agropecuarios
- ✓ Otros productos

Por su parte las importaciones pueden ser agrupadas según las Grandes Categorías Económicas.

Estas clasificaciones constituirán el primer nivel de agregación. Corresponderá analizar más adelante cuáles serán los otros niveles de desagregación hasta llegar a las “unidades elementales”.

En lo referente a la necesidad de definir y seleccionar las “unidades elementales” se debe efectuar en primer lugar un análisis del valor y comportamiento de los valores medios de cada una de las posiciones arancelarias. Entonces se establecen dos etapas en esta tarea. La primera está orientada a identificar las posiciones arancelarias que permiten alcanzar un nivel aceptable en la cobertura de la muestra, y al mismo tiempo priorizar aquellas que muestren permanencia en el tiempo. La segunda pretende demostrar la homogeneidad de los productos identificados en cada posición arancelaria a través del análisis de la variabilidad del valor medio de cada una de las posiciones arancelarias.

El análisis de la cobertura y permanencia en el tiempo de los productos se hizo sobre la base de la información suministrada por la ONE a la Asociación Latinoamericana de Integración (ALADI) para el período de tres años desde 1999 hasta 2001, en un ejercicio que se desarrollará en la tercera parte de este informe.

En cambio, el análisis de la homogeneidad de los productos no pudo ser desarrollado en este informe ya que es necesario contar con estadísticas mensuales de exportación e importación, que a la fecha no están disponibles. Una vez que se hallan obtenido estas estadísticas de los valores y volúmenes comercializados, se podrán construir estadísticas mensuales de valores medios. Del análisis de esta serie de valores y de la consideración de los datos de la evolución de

los precios internacionales de algunos productos (en especial *comodities*) se podrá apreciar el grado de homogeneidad de los productos. En algunos casos, las series de valores medios pueden mostrar algunas variaciones importantes por lo que será necesario en primer lugar descartar que no existan errores en los datos del volumen a partir de los cuales se elaboró la serie de valores medios. Una vez finalizada esta etapa es factible que se sigan observando en algunos casos comportamientos de volatilidad en las series. Esta situación probablemente sea como consecuencia de diferencias en la calidad de los productos incluidos en cada posición arancelaria. Una alternativa es analizar la posibilidad de que la variable país de origen de la mercadería pueda explicar el comportamiento volátil de los valores medios o que de lo contrario esa variable no contribuya a explicar este fenómeno y se presente entonces diferencias en los precios por calidades distintas de los bienes incluidos en la posición arancelaria analizada. Este problema suele presentarse en productos industriales y deben tomarse entonces determinaciones respecto a la definición de la “unidad elemental” incluyendo entonces un grupo de posiciones arancelarias que conformen en conjunto un todo homogéneo.

Por lo tanto, ya que este estudio sólo puede abordar la primera etapa en la selección de la muestra considera entonces como supuesto que cada unidad elemental está representada por una posición arancelaria, dejando para un futuro la consideración de que la unidad elemental puede estar conformada por un grupo de posiciones arancelarias. Es así como se analizó la información del valor de las exportaciones e importaciones clasificadas según la SACLAP. Cabe recordar que todas las operaciones de comercio exterior registradas en la Aduana se clasifican de este modo y que además utilizan las respectivas unidades de medida establecidas por la misma clasificación. Esta situación es importante porque más adelante se podrán construir los valores medios de cada una de las posiciones arancelarias.

## **2. Análisis de la información para la selección de las unidades elementales.**

Con el fin de seleccionar las posiciones arancelarias que resulten representativas y estables en el comercio internacional se ha comenzado el análisis a través de los datos de exportación e importación desagregados a nivel de capítulo, es decir para los dos primeros dígitos de la clasificación de la SACLAP o de la SA.

Es así que para establecer el nivel de cobertura se han clasificado cada uno de los capítulos en tres categorías: “A”, “B” y “C”.

Para asignar cada una de las categorías fue necesario ordenar los diferentes capítulos en orden decreciente de modo de calcular para cada uno de ellos el peso relativo en el total. Una vez resuelto, se acumuló la participación relativa de modo de asignar una “A” a los primeros capítulos cuya participación acumulada alcanzara al 80%. Se clasificó con una “B” a los capítulos que en orden decreciente acumularan el 10% del valor de las exportaciones o importaciones y una “C” a los restantes que completan el 10% restante.

Esta categorización se repite durante al menos tres períodos consecutivos de modo de analizar no sólo la cobertura sino la permanencia en el tiempo. Esta última característica resulta importante ya que se busca evitar la selección de mercaderías comercializadas por única vez o

que puedan presentar comportamientos atípicos lo que puede generar distorsiones al momento de efectuar el cálculo de los índices de precios.

En esta primera etapa se consideraron los capítulos que se han categorizado como "A" o "B", desechando los que fueron clasificados como "C".

Como este estudio se realiza para un conjunto de tres años consecutivos, se utilizó la categoría "X" para señalar aquellos capítulos que no tuvieron transacciones durante un período.

Es así como se le asignan a cada uno de los capítulos tres letras que pueden ser combinación de las categorías "A", "B", "C" y "X". Entonces se seleccionarán todas las categorías en las que se combinen las "A" y "B" y eventualmente alguna que pudiera aparecer con una "C" o "X" en el primer período. En líneas generales, se considerará que el resto de los capítulos que tengan "C" en al menos dos períodos no serán tenidos en cuenta en la segunda etapa.

A partir de esta selección preliminar de los capítulos, se deberá continuar con el análisis a nivel de ocho dígitos siguiendo el mismo procedimiento sólo que la participación relativa de cada una de las posiciones arancelarias se deberán calcular en este caso respecto al valor total del capítulo.

Este es entonces el procedimiento que se sugiere seguir para seleccionar aquellas posiciones arancelarias que permitan obtener un buen nivel de cobertura y permanencia en el tiempo. Luego, es necesario calcular los valores medios de las diferentes posiciones arancelarias que han sido seleccionadas en estas dos etapas de estudio, de modo de evaluar el comportamiento de la serie.

Dado que este estudio no podrá ser realizado hasta tanto no se elaboren estadísticas mensuales, no se tratará en profundidad en el presente informe el tema del análisis de la homogeneidad. Simplemente se anticipa que para el análisis de los valores medios de los diferentes tipos de mercaderías es conveniente contar con información exógena de los valores de tales transacciones como ser las cotizaciones de diferentes productos en los mercados internacionales. Esta información puede ser considerada para verificar la correlación en los movimientos de la serie de valores medios, obtenido de los datos de las transacciones reflejadas en las estadísticas de comercio exterior y la serie de las cotizaciones del producto analizado en los mercados internacionales. Esta comparación puede efectuarse en los productos denominados *comoditties* ya que generalmente presentan características de homogeneidad y sus mercados son transparentes.

En otros casos puede medirse la variabilidad relativa de los valores unitarios utilizando el coeficiente de variación (coeficiente entre el desvío estándar y la media aritmética) y estableciendo un "valor crítico" para determinar el rango de variación aceptable. Este análisis no es sencillo ya que generalmente deben tenerse en cuenta las características de los productos, las oscilaciones del mercados, los países de origen de la mercadería y otros hechos que pueden explicar las fluctuaciones.

De este análisis surgirán posiciones arancelarias que serán aceptadas y otras que no. En este último conjunto será necesario realizar un análisis que permita identificar características comunes entre las diferentes posiciones arancelarias de modo de agruparlas conformando de esta manera “unidades elementales”.

### 3. Ejercicio aplicando la información disponible de los años 1999 a 2001

#### 3.1 Exportaciones

El análisis efectuado sobre las exportaciones de los años 1999 a 2001 demuestra una alta concentración de productos, ya que en cinco capítulos del SA se concentran más del 80% del valor exportado en cada año. Además se observa continuidad en el tiempo.

Del total de 96 capítulos, 4 han sido clasificados como “AAA” en tanto 1 ha sido “AAB”, 2 “BBB”, 1 como “BCB” y otro como “CBC”. El resto, o sea 87 capítulos, han sido clasificados como “CCC”, “CCX”, “CXC”, “XCX” y “XXC”.

Recuérdese el significado de estas clasificaciones. Los capítulos de mayor importancia que concentran el 80% se clasifican como “A”, en tanto que los que reúnen el 10% hasta alcanzar el 90% se clasifican como “B” en tanto los otros concentran el 10% restante se clasifican como “C”. A su vez, aquellos capítulos que no tienen operaciones o resultan prácticamente insignificantes se clasifican como “X”.

A continuación se presenta una tabla en la que se identifican los principales capítulos del SA que reúnen alrededor del 92% del valor de las exportaciones de cada año.

#### Selección de los principales capítulos del SA según el método de clasificación "ABC"

Clasificación "ABC"	Capítulo del SA	Descripción del capítulo del SA
AAA	03	Pescados y crustáceos, moluscos y otros invertebrados acuáticos
	17	Azúcares y artículos de confitería
	24	Tabaco y sucedáneos del tabaco elaborados
	75	Níquel y sus manufacturas
AAB	20	Preparaciones de hortalizas, de frutas u otros frutos o demás partes de plantas
BBB	30	Productos farmacéuticos
	72	Fundición, hierro y acero
BCB	25	Sal; azufre; tierras y piedras; yesos, cales y cementos
CBC	27	Combustibles minerales, aceites minerales y productos de su destilación; materias bituminosas; ceras minerales

Como segundo paso, se analizaron todas las posiciones arancelarias del SACLAP de modo de aplicar el método de clasificación “ABC” que permita evaluar la cobertura y permanencia a lo largo del tiempo de los bienes que finalmente serán incorporados a la canasta de productos seleccionados para la elaboración del índice de precio de exportación. Por ello, se presenta en archivo adjunto (selecc\_expocuba.xls), en el que se han detallado los productos a ocho dígitos de la nomenclatura arancelaria, una clasificación de acuerdo con el método “ABC”. Este método ha sido aplicado en este caso al valor de las exportaciones de cada uno de esos productos relativos al valor de los productos del capítulo en su conjunto.

Dado que ya se habían seleccionado en una primera etapa los capítulos de mayor cobertura, es fácil seleccionar ahora del estudio completo los productos que componen cada uno de estos capítulos. De este modo, se pudieron analizar a modo de ejemplo los capítulos correspondientes a: *pescados y crustáceos, moluscos y otros invertebrados acuáticos; azúcares y artículos de confitería; tabaco y sucedáneos del tabaco elaborados y níquel y sus manufacturas*.

En el capítulo de *pescados y crustáceos, moluscos y otros invertebrados acuáticos* se puede observar el mismo fenómeno de concentración que se observa en las exportaciones en general. Esto se comprueba fácilmente cuando sólo ha resultado clasificada como “AAA” una de las 34 posiciones arancelarias, pudiéndose observar también una posición como “BAB”. Los productos restantes que suman 32 son de escasa significación para el capítulo.

En el capítulo de *azúcares y artículos de confitería* también ocurre lo mismo, ya que sólo uno de los 9 productos que han tenido operaciones en este capítulo resultó “AAA” en tanto el resto son del tipo “C”.

En el capítulo correspondiente a *tabaco y sucedáneos del tabaco elaborados* se observa que del conjunto de 12 productos exportados, uno resultó categoría “AAA” y otros “BBB”. Por su parte, si se observa el análisis del capítulo de *níquel y sus manufacturas* se comprueba que de los 5 productos negociados dos resultaron “AAA”.

En resumen seleccionando siete posiciones arancelarias de estos cuatro capítulos se obtiene una cobertura del 96% de los mismos. Si se comparan las exportaciones de estos productos con el valor total de las exportaciones se alcanzan valores del 75% en los años 1999 y 2000 y del 78% en el 2001.

Correspondería en este caso repetir del mismo modo el análisis para el resto de los capítulos señalados en el cuadro anterior.

### 3.2 Importaciones

En el caso de las importaciones la situación es diferente a las de las exportaciones ya que se presenta un alto grado de dispersión. Mientras en las exportaciones 4 capítulos fueron calificados como “AAA”, las importaciones 20 capítulos recibieron tal calificación.

Se presentaron 2 casos del tipo “BAA” y uno “ABA”. Otros 2 capítulos fueron calificados como “ABB”, en tanto 8 resultaron “BBB” y 2 más como “BCB”. En consecuencia, 35 capítulos

del SA resultan de interés en este análisis y reúnen aproximadamente 90% del valor de las importaciones totales.

A continuación se detallan estos capítulos con sus respectivas calificaciones. Puede observarse la variedad de productos que se incluyen en los mismos.

**Selección de los principales capítulos del SA según el método de clasificación "ABC"**

Clasificación "ABC"	Capítulo del SA	Descripción del capítulo del SA
AAA	27	Combustibles minerales, aceites minerales y productos de su destilación; materias bituminosas; ceras minerales
AAA	84	Reactores nucleares, calderas, máquinas, aparatos y artefactos mecánicos; partes de estas máquinas o aparatos
AAA	85	Máquinas, aparatos y material eléctrico y sus partes; aparatos de grabación o de reproducción del sonido, aparatos de grabación o de reproducción de imágenes y sonido de televisión, y las partes y accesorios de estos aparatos
AAA	87	Vehículos automóviles, tractores, velocípedos y demás vehículos terrestres, sus partes y accesorios
AAA	10	Cereales
AAA	39	Plástico y sus manufacturas
AAA	04	Leche y productos lácteos; huevos de ave; miel natural; productos comestibles de origen animal n.c.o.p.
AAA	90	Instrumentos y aparatos de óptica, de fotografía o cinematografía, de medida, control o precisión; instrumentos y aparatos médico-quirúrgicos; partes y accesorios de estos instrumentos o aparatos
AAA	73	Manufacturas de fundición, hierro y acero
AAA	02	Carne y despojos comestibles
AAA	48	Papel y cartón; manufacturas de pasta de celulosa, de papel o de cartón
AAA	38	Productos diversos de las industrias químicas
AAA	94	Muebles; mobiliario médico-quirúrgico; artículos cama y similares; aparatos de alumbrado n.c.o.p.; anuncios, letreros y placas indicadoras luminosas y artículos similares; construcciones prefabricadas
AAA	40	Caucho y sus manufacturas
AAA	64	Calzados, polainas y artículos análogos; partes de estos artículos
AAA	76	Aluminio y sus manufacturas
AAA	07	Hortalizas, plantas, raíces y tubérculos alimenticios
AAA	72	Fundición, hierro y acero
AAA	28	Productos químicos inorgánicos; compuestos inorgánicos u orgánicos de metales preciosos, de elementos radioactivos, de metales de las tierras raras o de isótopos
AAA	62	Prendas y complementos (accesorios) de vestir, excepto los de punto
BAA	11	Productos de molinería; malata; almidón y fécula; inulina; gluten de trigo
BAA	16	Preparaciones de carne, pescado o de crustáceos, moluscos o demás invertebrados acuáticos
ABA	31	Abonos
ABB	15	Grasas y aceites animales o vegetales; productos de su desdoblamiento; grasas alimenticias elaboradas; ceras de origen animal o vegetal
ABB	23	Residuos y desperdicios de las industrias alimentarias; alimentos preparados para animales
BBB	32	Extractos curtientes y tintóreos; taninos y sus derivados; pigmentos y demás materias colorantes; pinturas y barnices; mástiques; tintas
BBB	29	Productos químicos orgánicos
BBB	70	Vidrio y sus manufacturas
BBB	69	Productos cerámicos
BBB	61	Prendas y complementos (accesorios) de vestir, de punto
BBB	83	Manufacturas diversas de metal común
BBB	63	Los demás artículos textiles confeccionados; juegos; prendería y trapos
BBB	34	Jabones, agentes de superficie orgánicos, preparaciones para lavar, preparaciones lubrificantes, ceras artificiales, ceras preparadas, productos de limpieza, velas y artículos similares, pastas para modelar, "cers para odontologi" y preparacionse para uso
BCB	30	Productos farmacéuticos
BCB	44	Madera, carbón vegetal y manufacturas de madera

Tal como ya se efectuó para el caso de las exportaciones, una vez identificados los principales capítulos, se inicia la segunda etapa en el análisis aplicando el método "ABC" a las posiciones arancelarias del SACLAP incluidas en tales capítulos.

Los resultados de la aplicación del método “ABC” sobre todos los productos importados pueden observarse en la planilla de cálculo anexa `selecc_impocuba.xls`. El volumen de información dificulta la elaboración de cuadros resúmenes. En consecuencia se ha tratado de enumerar algunos aspectos salientes, que por el momento sólo intentan dimensionar la tarea de la selección de la muestra para la elaboración de los números índices. En efecto, la selección de la muestra para la elaboración del índice de importación no sólo resulta más compleja que la del índice de precios de exportación por las diferencias en el grado de diversificación de los productos sino que además se agrega la dificultad que hasta el momento no es posible evaluar respecto a la heterogeneidad de los productos.

Por lo anteriormente expuesto, se hacen algunos comentarios salientes, relacionados con los productos incluidos en los capítulos que obtuvieron la calificación “AAA”. El archivo que originalmente contiene el movimiento de aproximadamente 4.900 posiciones arancelarias, se reduce de este modo a alrededor de 2.330 productos. Si a su vez, se consideran de ellas aquéllas que reúnen calificación “AAA” para su capítulo, las mercaderías se reducen a 316. Estas representan en conjunto un valor respecto al de las importaciones de los capítulos seleccionados del 73%, 75% y 66% para los años 1999, 2000 y 2001, respectivamente.

En el cuadro siguiente se puede observar de qué manera se distribuye la selección de 316 productos según los capítulos a los que pertenecen. Los capítulos que nuclean maquinarias, aparatos y artefactos mecánicos y eléctricos, partes, instrumental y vehículos de transporte terrestre, se caracterizan por reunir un gran número de productos. Es de esperar que estos productos presenten diferencia en sus calidades. En muchos casos esas diferencias de calidad están asociadas a diferencias en los precios, razón por la cual se trata de profundizar la especificación del producto, por ejemplo al país de origen de la mercadería, de modo que es probable que el número de posiciones arancelarias se multiplique. Por el contrario, otras veces estas diferencias no están relacionadas con el país de origen, razón por la cual estas posiciones suelen agruparse con el fin de que al hacerlo reúnan características comunes y similares a las de los deflatores disponibles.

**Distribución de posiciones arancelarias a 8 dígitos de SACLAP con clasificación "AAA", según el capítulo al cual pertenecen**

Capítulo del SA	Descripción del Capítulo del SA	Nº posiciones SACLAP clasif. "AAA"
27	Combustibles minerales, aceites minerales y productos de su destilación; materias bituminosas; ceras minerales	3
84	Reactores nucleares, calderas, máquinas, aparatos y artefactos mecánicos; partes de estas máquinas o aparatos	69
85	Máquinas, aparatos y material eléctrico y sus partes; aparatos de grabación o de reproducción del sonido, aparatos de grabación o de reproducción de imágenes y sonido de televisión, y las partes y accesorios de estos aparatos	50
87	Vehículos automóviles, tractores, velocípedos y demás vehículos terrestres, sus partes y accesorios	14
10	Cereales	2
39	Plástico y sus manufacturas	22
04	Leche y productos lácteos; huevos de ave; miel natural; productos comestibles de origen animal n.c.o.p.	2
90	Instrumentos y aparatos de óptica, de fotografía o cinematografía, de medida, control o precisión; instrumentos y aparatos médico-quirúrgicos; partes y accesorios de estos instrumentos o aparatos	26
73	Manufacturas de fundición, hierro y acero	26
02	Carne y despojos comestibles	4
48	Papel y cartón; manufacturas de pasta de celulosa, de papel o de cartón	14
38	Productos diversos de las industrias químicas	7
94	Muebles; mobiliario médico-quirúrgico; artículos cama y similares; aparatos de alumbrado n.c.o.p; anuncios, letreros y placas indicadoras luminosas y artículos similares; cosntucciones prefabricadas	8
40	Caucho y sus manufacturas	12
64	Calzados, polainas y artículos análogos; partes de estos artículos	7
76	Aluminio y sus manufacturas	7
07	Hortalizas, plantas, raíces y tubérculos alimenticios	3
72	Fundición, hiero y acero	18
28	Productos químicos inorgánicos; compuestos inorgánicos u orgánicos de metales preciosos, de elementos radioactivos, de metales d elas tierras raras o de isótopos	6
62	Prendas y complementos (accesorios) de vestir, excepto los de punto	16

#### IV. ANÁLISIS DE LA CALIDAD DE LOS VALORES MEDIOS, SELECCIÓN DE PRODUCTOS Y CALCULO DE LAS PONDERACIONES

##### 1. Análisis de la calidad de los datos

Tal como se comentara anteriormente, la elaboración de los índices de precios conlleva el análisis de las variables valor y cantidades o volumen de cada una de las transacciones de comercio exterior, ya que éstas intervienen en la construcción de los precios o valores medios. Estos valores deberán ser sometidos en una segunda etapa a un análisis de su variabilidad, de modo de evaluar si estos valores pueden ser incorporados directamente en el cálculo de los índices de precio, o si en su defecto se debe considerar la posibilidad de incorporar un deflactor “*proxy*”.

En este punto se desarrollarán algunas técnicas para el análisis de las variables de valor, cantidades y volumen con el fin de detectar los posibles errores en las declaraciones aduaneras, los que suelen producirse en las medidas de volumen.

Por tal motivo, se consideró la información disponible de las transacciones de exportaciones e importaciones del año 2001. En primer lugar, se analizaron los valores y volúmenes informados en cada una de las transacciones de los diferentes bienes, de modo de establecer algún criterio que permita identificar prioridades en la realización de la tarea de análisis de las operaciones de comercio exterior. En este sentido, cabe mencionar que durante este año se registraron 11.392 transacciones de mercaderías de exportación y 520.932 de mercaderías de importación. Estos números resultan superiores a los de las declaraciones aduaneras de exportación e importación, debido a que una declaración puede contener más de un tipo de mercadería.

Para ello, se consideraron tres valores y volúmenes diferentes: de Dls. 1.000 y Kg. 1.000, de Dls. 5.000 y Kg 5.000 y Dls. 10.000 y Kg. 10.000. Se calculó el porcentaje que esas operaciones representaron para el total del valor de las exportaciones y de las importaciones y para el número total de mercaderías transadas. En el cuadro siguiente puede apreciarse esta distribución.

**Participación en el valor y número de transacciones del comercio exterior de Cuba del año 2001, según rango de valores.**

Valor y volumen de cada transacción	Exportaciones		Importaciones	
	Porcentaje del valor	Porcentaje del número de transacciones	Porcentaje del valor	Porcentaje del número de transacciones
Inferior a Dls. y Kg. 1.000	0,1	28,0	1,8	65,1
Superior a Dls. o Kg.1.000	99,9	72,0	98,2	34,9
Inferior a Dls. y Kg. 5.000	0,4	46,2	6,7	84,1
Superior a Dls. o Kg.5.000	99,6	53,8	93,3	15,9
Inferior a Dls. y Kg. 10.000	0,7	53,9	10,8	89,2
Superior a Dls. o Kg.10.000	99,3	46,1	89,2	10,8

Puede apreciarse que las exportaciones de bienes inferiores a los Dls. 10.000 y Kg. 10.000 fueron más de la mitad de las operaciones realizadas durante el año 2001, en tanto que esas transacciones sólo representan menos del 1% del valor total de las exportaciones de ese año. En el caso de las importaciones la proporción es más alta, llegando a sumar casi el 90% de las operaciones y representando cerca del 11% del valor de las importaciones de este período.

Como puede apreciarse, el análisis puede acotarse a un número bastante inferior al del total transacciones de mercaderías de exportación e importación, aproximadamente 5.250 para las exportaciones y 56.000 para las importaciones si se adopta el criterio de valor superior a Dls. 10.000 o peso superior a kg. 10.000. Este análisis restringido garantiza el 99% del valor total de las exportaciones y el 89% de las importaciones, razón por la cual no se corren prácticamente riesgos en cuanto a la calidad de datos para el cálculo de los índices de precios. Este ejercicio puede ser ampliado de modo de acotar aún más el número de observaciones que deben ser controladas. El objetivo del mismo es optimizar la utilización de recursos humanos e informáticos, en particular de los primeros que suelen ser los más escasos.

Aún considerando que esta tarea es de gran envergadura, se propone un método de análisis exploratorio de datos que puede ser de utilidad para agilizar la tarea.

Una vez seleccionadas las transacciones de mayor valor y volumen se procede a aplicar el siguiente método de análisis de los precios medios. El método consiste en aplicar distintas medidas de orden a las observaciones de precios medios, de modo de estimar valores límites (inferior y superior) que permitan identificar con rapidez y eficiencia los valores que merecerían la revisión de un analista. Este método puede aplicarse a las observaciones de un mes o de períodos más largos. En el primer caso, podrá ocurrir que el número limitado de observaciones de transacciones de ciertos productos no permita la aplicación de este método. En el caso de la elección de períodos más largos es probable que se garantice el número mínimo de observaciones, aunque deberá tenerse especial cuidado cuando se presenten fluctuaciones importantes en los precios medios de ciertos productos durante el período analizado.

Como primer paso, se agrupan todas las mercaderías que respondan a la misma nomenclatura, país de destino o de origen, según sea el caso de las exportaciones o importaciones. Si el número de transacciones es como mínimo de 12 se calculan las siguientes medidas de orden:

- $Q_1$ = cuartil de orden 1
- $Q_3$ = cuartil de orden 3
- $P_1$ = percentil 1
- $P_{99}$ = percentil 99
- $Q_{range}$ = rango intercuartílico
- Lim inferior:  $Li = Q_1 - 3 \cdot Q_{range}$
- Lim superior:  $Ls = Q_3 + 3 \cdot Q_{range}$

Se genera un archivo con todas las observaciones cuyos precios unitarios estén fuera de estos límites. Para los casos en que el valor del límite inferior sea negativo<sup>10</sup> los límites inferior y superior serán reemplazados respectivamente por los percentiles 1 ( $P_1$ ) y 99 ( $P_{99}$ ).

Aquellas transacciones que no pudieron ser analizadas en el paso anterior ya que el número de observaciones no fue suficiente, se reagrupan sin considerar el país de destino u origen de la mercadería. Se repite el análisis efectuado en la primera etapa seleccionando las transacciones cuyos precios medios exceden los límites establecidos, los que deben ser analizados en forma específica.

Si el período de análisis fuera superior a un mes, se puede extender el análisis de las transacciones a nivel de posición arancelaria ya no para un mes determinado sino para un período más extenso.

El resto de las transacciones que no reúnen las condiciones para ser analizados de esta manera deberían ser detalladas para su análisis a través de otro método.

Asimismo, en el análisis de los precios medios vale la pena analizar la relación entre las unidades de medida en términos bruto y neto, así como las unidades de medida estadística y de venta, ya que no sólo dan un indicio del error en alguna de estas variables sino que puede resultar útil para la estimación del valor correcto.

Por tal motivo, se incluye en anexo archivos que muestran los resultados de este análisis aplicado a los datos mensuales suministrados por la Oficina Nacional de Estadísticas de Cuba. Estos archivos se denominan análisis\_expo2001.xls y análisis\_impo2001.xls . Los mismos incluyen todas las transacciones de exportación e importación que han sido seleccionadas a partir de las condiciones establecidas como primer paso. Es decir aquellas transacciones que respondan a una nomenclatura y país de destino o de origen, según sean exportaciones o importaciones respectivamente, y que reúnen un mínimo de 12 observaciones. El número de observaciones analizadas quedaron reducidas a 2.911 y 27.127 para las exportaciones e importaciones, respectivamente.

Este análisis fue complementado por las marcas del análisis “ABC” efectuado para comprobar la cobertura y permanencia en el tiempo de las posiciones arancelarias, de modo que esta información resulta útil para el análisis de los precios medios ya que permite priorizar esta tarea.

El archivo contiene entonces la información de cada una de las transacciones de las operaciones que reunieron las condiciones del primer paso de análisis en el que pueden apreciarse las siguientes variables:

- ✓ mes de la operación,
- ✓ marca “ABC” correspondiente a la nomenclatura,
- ✓ nomenclatura y país,
- ✓ peso bruto, neto y declaración del volumen según las unidades de medidas estadísticas,

---

<sup>10</sup> Estos valores pueden presentarse en distribuciones de precios medios asimétricas.

- ✓ los valores FOB y CIF según corresponda a exportaciones e importaciones,
- ✓ el precio medio calculado como el valor/peso neto de cada transacción,
- ✓ cociente entre el peso bruto y el neto,
- ✓ número de observaciones de la clase formada por la nomenclatura país,
- ✓ precio medio de la clase,
- ✓ coeficiente de variación de los precios medios de la clase y
- ✓ percentil 1 y 99, primer y tercer cuartil, límite inferior y superior del intervalo.

El archivo contiene ciertas observaciones en los valores de la relación entre el peso bruto y el neto (superior a 5) y en el coeficiente de variación de los precios medios (superior a 100), que tienden a advertir sobre los casos más llamativos. Sin embargo, la información contenida en el archivo es aún más rica, ya que permite detectar aquellas transacciones cuyos precios medios no se incluyen en el intervalo establecido. Estas operaciones merecen atención en términos de confirmar su veracidad o contemplar las características específicas que justifican un valor extremo en la serie, así como la variabilidad propia de la clase derivada de diferentes calidades de productos.

Del análisis de estos archivos pueden detectarse errores en la declaración de los volúmenes, cuya corrección es indispensable para el cálculo posterior de los precios medios. En este sentido, se destaca que no existen declaraciones de pesos netos inferiores al bruto. En términos de las diferencias importantes en el peso neto respecto al bruto se destacan las que se observaron en algunas exportaciones de tabaco, de langosta congeladas y de ron, productos inicialmente seleccionados para la muestra del índice. También es importante observar valores altos en los coeficientes de variación de las exportaciones de azúcar que seguramente se deben a errores en las declaraciones de peso neto. Por la importancia que reviste este producto deben eliminarse estos errores, a fin de analizar *a posteriori* la importancia de la especificación del producto considerando el país de destino.

Cabe señalar que no debe olvidarse que los pasos seguidos en el análisis hasta el momento tienden a reducir la asignación de tiempo y recursos humanos en una tarea de análisis que es indispensable para elaborar los índices de precios. Para ello el objetivo ha sido focalizar la atención en las operaciones de mayor envergadura y en aquellas que por el número de observaciones son pasibles de la aplicación de métodos de análisis exploratorio de datos, considerando también la importancia que tales productos tienen dentro de cada capítulo del SA en cuanto a su cobertura y permanencia en el tiempo (método "ABC"). Sin embargo, no debe perderse el interés por las restantes operaciones que no cumplen con alguna de las condiciones antes señaladas. Por ejemplo, se observaron en las transacciones de exportaciones del capítulo 09 (café) falta en la información del peso, razón por la cual este método la descarta. Sin embargo este producto ha sido seleccionado en la muestra por su importancia.

## **2. Selección de productos y cálculo de ponderadores**

Si bien, la selección final de productos exige no sólo la depuración fundamentalmente de los errores en las declaraciones de peso, que serán utilizadas para la estimación de los valores medios, sino el análisis de las clases seleccionadas en términos de la homogeneidad de los productos así como la importancia que estos productos no sólo revisten en el capítulo del SA al

cual pertenecen sino la que pueden tener en relación a los distintos niveles de agregación con los que se decide trabajar.

En este sentido, en esta parte del informe se persigue desarrollar un ejemplo de selección de la muestra de productos de exportación, evaluación de la cobertura a nivel general y de las clasificaciones utilizadas, para posteriormente abordar el cálculo de los ponderadores de cada uno de los índices elementales que se deberán construir en función de los precios observados en la base (año 1997). Para ello, se consideró la clasificación utilizada por la ONE en su anuario estadístico, así como los últimos datos del año 2001 allí publicados.

**Exportaciones de mercancías, por Grupos de Productos**

Concepto	Millones de \$ 2001
<b>Total</b>	1.660,6
Productos de la industria azucarera	545,3
Productos de la minería	464,8
Productos de la industria del tabaco	263,1
Productos de la pesca	79,2
Productos agropecuarios	30,7
Otros productos	277,5

En este sentido, se seleccionaron inicialmente 29 productos, cuya cobertura para el año 2001 asciende al 88,3%. Sin embargo, es fundamental revisar esta selección para el año considerado base, de modo de asegurar una situación similar en términos de cobertura.

Los productos seleccionados han sido clasificados teniendo en cuenta básicamente la clasificación publicada en el anuario. La excepción ha sido la de los productos agropecuarios que se han agrupado con los otros productos, debido a que se los consideró de una importancia relativa visiblemente inferior a la del resto de los grupos. De todos modos, esto se debe interpretar como un ejercicio y no como una recomendación.

En este ejemplo, existen un máximo de 3 niveles diferentes para la agregación de los índices elementales en la elaboración del índice general. Nótese que en la medida en que se especifique el producto seleccionado, por ejemplo incorporando el país de destino, aumenta la cantidad de niveles de agregación, así como si se decide trabajar en forma independiente con la clasificación de productos agropecuarios.

El primer nivel corresponde a la desagregación de productos de la industria azucarera, de la minería, de la industria del tabaco, de la pesca y otros. El segundo nivel corresponde para los productos de la industria azucarera de la minería, de la industria del tabaco y de la pesca a cada

uno de los productos que han sido seleccionados, en tanto para otros productos el segundo nivel está compuesto por el total de la clasificación de productos agropecuarios y otros productos propiamente dichos, en tanto el tercer nivel está compuesto por cada uno de los productos que representan respectivamente a estas dos clasificaciones.

**Propuesta de muestra para el índice de precios de exportación**

Clasificación	Posición arancelaria	Descripción	Año 2001	Cobertura porcentual	
				En el total	En su clase
<b>Total</b>			<b>1.660,6</b>	<b>100,0%</b>	
Productos de la industria azucarera			<b>545,3</b>	<b>32,8%</b>	<b>100,0%</b>
	17011100	Azúcar de caña	546,5		
Productos de la minería			<b>464,8</b>	<b>28,0%</b>	<b>92,6%</b>
	75012020	Níquel	239,8		51,6%
	75012090	Níquel	190,7		41,0%
Productos de la industria del tabaco			<b>263,1</b>	<b>15,8%</b>	<b>76,6%</b>
	24011010	Tabaco en hojas	20,3		7,7%
	24021010	Cigarros	181,2		68,9%
Productos de la pesca			<b>79,3</b>	<b>4,8%</b>	<b>97,7%</b>
	03061100	Langostas congeladas	63,5		80,1%
	03061300	Camarones congelados	9,9		12,5%
	03062100	Langostas sin congelar	4,1		5,2%
Otros Productos			<b>308,2</b>	<b>18,6%</b>	<b>68,1%</b>
Productos agropecuarios			<b>30,7</b>		
	04090000	Miel natural	5,7		1,8%
	08051000	Naranjas	6,1		2,0%
	08054000	Toronjas	5,6		1,8%
	09011110	Café en grano	9,7		3,1%
Otros productos propiamente dichos			<b>277,5</b>		
	20091100	Jugos de toronjas	25,9		8,4%
	20092000	Jugos de naranjas	23,1		7,5%
	22084090	Ron	12,4		4,0%
	25231000	Cemento	15,3		5,0%
	25232900	Los demás cementos	12,5		4,1%
	30021000	Antisúeros	1,1		0,4%
	30022000	Vacunas para medicina humana	26,8		8,7%
	30029090	Los demás preparados para uso terapéutico	5,7		1,8%
	30042000	Medicamentos	1,3		0,4%
	30049000	Los demás medicamentos	4,2		1,4%
	71129000	Desechos de metal	9,6		3,1%
	72072000	Producto intermedios de hierro o acero	26,5		8,6%
	72142000	Barras de hierro o acero sin alear	9,6		3,1%
	74040000	Desechos del cobre	2,8		0,9%
	74081100	Alambre de cobre	1,7		0,6%
	90181900	Las demás partes de aparatos de medicina	4,3		1,4%

Una vez evaluada la composición de la muestra a nivel anual, procederemos a observar el comportamiento de las exportaciones de estos productos en los diferentes trimestres del año. La información del año 2001 permite elaborar el siguiente cuadro:

**Propuesta de muestra para el índice de precios de exportación. Exportaciones trimestrales año 2001**  
En millones de \$

Clasificación	Posición arancelaria	Año 2001	Trimestres			
			I	II	III	IV
<b>Total</b>		<b>1.660,6</b>				
Productos de la industria azucarera		<b>545,3</b>	290,3	235,2	15,9	5,1
	17011100	546,5	290,3	235,2	15,9	5,1

	74081100	1,7	0,3	0,6	0,3	0,5
	90181900	4,3	0,3	0,0	0,0	4,0

Previo a la elaboración de los índices elementales se habrán analizado los datos del volumen con el fin de eliminar los posibles errores que puedan existir, así como obtenido los datos de los indicadores “*proxy*” en caso de no haber aprobado la utilización del valor medio.

Tal como se mencionara anteriormente, es necesario construir la estructura de los ponderadores a fin de agrupar estos índices elementales, respetando el orden de los diferentes niveles de agregación, de modo de alcanzar el nivel general del índice. Esta estructura de ponderadores se construye a partir de los datos del valor de las exportaciones trimestrales. Debido a que no se dispone de datos trimestrales para cada una de las clasificaciones publicadas en el anuario, se dejará expresada la metodología para su construcción.

Como ejemplo, se considerará el cálculo de los ponderadores de los índices elementales de los productos seleccionados para representar la clase de productos de la pesca.

**Ejemplo del cálculo de los ponderadores de los índices elementales**

Clasificación	Posición arancelaria	Trimestres			
		I	II	III	IV
<b>Valores exportados</b>					
Productos de la pesca		16,0	12,5	18,3	30,7
	03061100	12,0	9,9	15,9	25,7
	03061300	3,1	2,4	1,3	3,1
	03062100	0,9	0,2	1,1	1,9
<b>Ponderación de los índices elementales</b>					
Productos de la pesca		100,00	100,00	100,00	100,00
	03061100	75,00	79,20	86,89	83,71
	03061300	19,38	19,20	7,10	10,10
	03062100	5,63	1,60	6,01	6,19

De este modo, si dispusiéramos de los índices de cada uno de estos productos, denominémoslos por comodidad 1, 2 y 3. Entonces el índice de precios de los productos de la pesca para el primer trimestre se calcularía como sigue:

$$IP_{\text{productos de la pesca } N2,I,'01} = \left( \sum_{i=1}^3 IP_{i,I,'01}^{-1} \bullet W_{N2,i,I,'01} \right)^{-1} \bullet 100$$

donde  $I_{i,I,'01}$  es el índice elemental del producto  $i$  para el I trimestre del año 2001 y  $W_{N2,i,I,'01}$  es la ponderación de elemento  $i$  que integra el segundo nivel de agregación en el trimestre I del año 2001.

$$\text{donde } W_{N2,i,I,'01} = \frac{V_{i,I,'01}}{\sum_{i=1}^3 V_{N2,i,I,'01}}$$

De esta manera se elaborarán los índices de precios de productos de la industria azucarera, de la minería, de la industria del tabaco, productos agropecuarios y otros productos. En realidad en lo que respecta al índice de la industria azucarera, en principio es igual al índice elemental a menos que luego de determinar la importancia de desagregar esta nomenclatura por países o grupos de países se cambie la especificación actual.

En lo que respecta a la agregación a partir de ese nivel, se requiere construir el ponderador de esta clase respecto al total y de cada una de las restantes clasificaciones que pertenecen al último nivel de agregación. En este caso estos ponderadores se construyen con el valor corriente

total de cada clase respecto al total general y no ya con los valores de la muestra, como sucede en el primer paso de la agregación.

$$W_{Nk,i,j,t} = \frac{V_{Nk+1,j,t}}{\sum_{i=1}^n V_{Nk+1,j,t}}$$

donde: k puede valer 0,1,2 indicando los tres niveles de agregación descriptos y  $V_{Nk+1,j,t}$  es el valor corriente del nivel k+1 en el trimestre j del año t

$$IP_{Nk,j,t} = \left( \sum_{Nk+1} IP_{Nk+1,j,t}^{-1} W_{Nk+1,j,t} \right)^{-1} \cdot 100$$

donde: k=0,1,2 n, siendo 0 el nivel de agregación del índice general.

### Consideraciones finales

Una vez realizadas las consultoría y ejercicios ya comentados, se recomienda mantener observancia sobre un conjunto de puntos “críticos” detectados a lo largo del análisis.

- Seleccionar una muestra de productos del comercio exterior de Cuba, teniendo en cuenta los criterios de cobertura y continuidad en el tiempo, considerando la información disponible entre los años 1999 y 2001 así como también el año 1997 (base de las cuentas nacionales). Esta muestra se utilizará para la confección de las “unidades elementales”, las ponderaciones y los índices de precios.
- Elaborar series de datos de frecuencia mensual para las exportaciones y las importaciones. Estas series servirán para identificar las “unidades elementales” así como para evaluar la variabilidad de los valores unitarios. Los valores unitarios se construyen inicialmente para cada una de las posiciones arancelarias a partir de los valores FOB (exportaciones), los valores CIF (importaciones) y de las cantidades físicas expresadas en unidades de peso neto<sup>11</sup>.
- Disponer de información de las cotizaciones de los productos primarios o con escaso grado de elaboración, vigentes en los mercados internacionales. Estas cotizaciones se utilizarán para contrastar los datos obtenidos a partir de los registros aduaneros.
- Profundizar la especificación de los productos cuyos valores unitarios presenten una alta volatilidad. Esto significa determinar el país de origen de la mercadería, la empresa exportadora, etc. con el objeto de obtener grupos de bienes más homogéneos. Si todavía persistiera la heterogeneidad se deberá recurrir a fuentes de información distintas de los documentos aduaneros: índices de precios de exportación de los países

<sup>11</sup> En algunas posiciones arancelarias también se dispone de información sobre otras unidades de medida como sor, entre otras, cantidades unitarias, metros cúbicos, litros, pares y kilowatts que difieren de la unidad estadística y generalmente están asociadas a la unidad de venta. Esta información es de utilidad y no debe desecharse.

líderes en el comercio internacional ó indicadores confeccionados a partir de encuestas directas a las principales empresas exportadoras o importadoras residentes en el país. En cualquiera de los dos casos sugeridos será necesario extender la definición de “unidad elemental” a un grupo de posiciones arancelarias, clasificadas en la SACLAP, en la cual se incluyan las transacciones que en conjunto conformen un todo homogéneo.

- e) Agregar las exportaciones de acuerdo al nomenclador local y agregar las importaciones en función del clasificador de Grandes Categorías Económicas internacionalmente aceptado.

La DCN-ONE se encuentra en condiciones de comenzar a realizar la elaboración de los índices de precios de exportación e importación utilizando la fórmula tipo Paasche con base en el año 1997. De ésta manera los índices de cantidades se obtendrán en forma indirecta, mediante el cociente entre los correspondientes índices de valor y de precios. De acuerdo a lo expuesto anteriormente los índices de cantidades resultarán del tipo Laspeyres.
